Question No : 1 - (Topic 1)

An administrator is using Update Manager 5.x to update virtual appliances in a vSphere environment. The environment is using the vCenter Server Virtual Appliance (vCSA).

What would cause the remediation to fail?

A. Updating of the appliance can only be done if the vCenter Server Virtual Appliance (vCSA) has been put into Maintenance Mode.
B. Remediation must be configured on the Appliance Administration page before use.

Answer: D

Explanation:
Update Manager 5.0 does not support virtual machine patch baselines.If a host is connected to vCenter Server by using an IPv6 address, you cannot scan and remediate virtual machines and virtual appliances that run on the host.

Question No : 12 - (Topic 1)

For security reasons, an administrator removes a user from the Active Directory domain used by all ESXi hosts for authentication. At the time the user is removed they are actively logged into an ESXi 5.x host through the vSphere Client.

What is true regarding this scenario?

A. The user immediately loses connectivity to and permissions on the host.
B. The user retains permissions and connectivity to the host for up to 24 hours.
C. The user retains permissions on the host until the host is rebooted.

Answer: C

Explanation: You can remove a user from the host.

Users who are logged in and are removed from the domain keep their host permissions until you restart the host.

To remove users from vCenter Server, you must remove them from the domain or Active Directory users list.

Users who are logged in and are removed from the domain keep their vSphere permissions until the next validation period. The default is every 24 hours.
